GDP (PPP) is gross domestic product converted into international dollars using purchasing power parity. The international dollar has the same purchasing power relative to GDP as the US dollar has in the United States. Purchasing power parity (PPP) between two countries A and B is the ratio of the number of currency units of country A required to buy in country A the same amount of a particular good or service that one currency of country B can buy in country B. PPP can be expressed in the currency of one of the countries. In practice, it is usually calculated for a large number of countries and expressed in a single currency, most often the US dollar (US$) is used as the base or settlement currency.
